

ATBM® - Automated Total Body Mapping

State-of-the-art in skin cancer prevention.

Many melanomas develop de novo and not from a pre-existing mole. That's why standardized total body photography in combination with digital dermoscopy is without doubt the best method for comprehensively monitoring patients at risk of developing skin cancer. The fully automated **ATBM Tower** from FotoFinder sets entirely new standards as it offers your patients so much more than conventional video documentation. The system monitors each and every individual nevus and the entire surface of the skin.

Full body status with spectacular speed.

FotoFinder **bodystudio ATBM** enables standardized documentation of the entire skin surface in minimum time. A world first, the system positions the camera automatically to photograph the patient from head to toe. To do this, the system only needs to know the body height. With the help of FotoFinder **SmartMatch** technology, the system generates a high definition image for each of the four sides of the body, including palms and soles.

Setting the Pace in Skin Imaging Worldwide.

Total body mapping and dermoscopy combined.

FotoFinder **bodystudio ATBM** combines total body mapping and dermoscopy better than ever before. In a matter of seconds, all relevant nevi are digitally numbered in the whole body photos and the dermoscopic images are captured and assigned to the numbers. If required, the **Moleanalyzer** can provide an immediate second opinion with a malignancy score. All at consistently high levels of sensitivity and specificity!

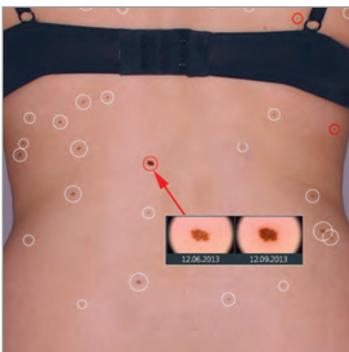

New and changed nevi detected at a glance.

High-risk patients are examined at close intervals. Follow-up images are also automatically captured during the check-ups. The integrated laser system ensures the position of the patient can be reproduced. As soon as the photos are saved, the **Bodyscan ATBM** has already compared them with the images from the previous examination automatically and you can see all the new and changed lesions at a glance. A new way of ensuring patient loyalty!

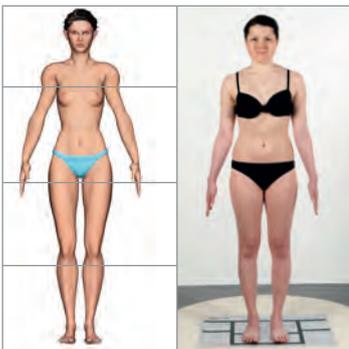

Maximum security for you and your patients.

The FotoFinder **bodystudio ATBM** procedure can be seamlessly integrated into the everyday workings of your practice as it reduces time-consuming total body photography to a minimum. The system's user-friendly operation means that the imaging process can easily be delegated to assistants. Fully automated, spectacularly fast and extremely precise, FotoFinder **bodystudio ATBM** complements your medical expertise!

Benefits at a glance:

- Standardized total body images in brilliant quality
- Fast documentation of the complete skin surface
- Tower with fully automated camera movement
- Laser positioning system
- **Bodyscan ATBM** displays changes immediately
- Unrivalled Full HD quality dermoscopy
- **Moleanalyzer** with malignancy score
- Comprehensive reports for your patients
- Integration into practice administration and network
- Future-proof FotoFinder technology
